## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Yura US # 5,821,727.

Yura discloses an induction motor controlling device for controlling a speed of the motor without a speed detector. Wherein, in Fig. 1 Yura shows:

- An inverter apparatus 26;
- An excitation current detector 4a, b, c;
- A three-to-two phase converting means 16 having motor current angular velocity provided from a two-phase sinusoidal wave generator 22 and instantaneous current values as the input and the excitation current value and torque current value as the output. A first subtracter 8, which subtracts the excitation current value from excitation current command and obtains an excitation current error. This reads on applicant's, "detecting of the excitation current of the motor and setting limitation level of the excitation current";
- A speed error data delivered from subtracter 1 and means for amplifying the speed error 2 to supply torque current command;

- A subtracter 5 which subtracts the torque current value from the torque current command and outputs torque current error;
- Means for amplifying a torque current error (12) to supply torque current common phase voltage command. And means for estimating a slip frequency, (see column 2, lines 63-67 and column 3, lines 1-8). That reads on applicant's producing torque command in response to frequency command.

Discussed above elements are part of process for controlling motor speed based on obtained frequency and voltage, wherein producing a compensation value for changing the torque command so that detected excitation current is smaller than targeted limitation is inherent.
